Problem 1: Money Supply Increases

This is just a preliminary question, since we'll be moving around the money supply a lot in later questions. Anyway... show what happens when the money supply increases.

Problem 2: Government Spending Increases

- (a) The exchange rate is allowed to float and there is no stabilization policy.
- **(b)** The exchange rate is fixed and there is no stabilization policy.
- (c) The exchange rate is floating, the central bank uses monetary policy to stabilize *Y*.

Problem 3: Consumer Confidence Decreases

- (a) The exchange rate is allowed to float and there is no stabilization policy.
- **(b)** The exchange rate is fixed and there is no stabilization policy.
- (c) The exchange rate is floating, the central bank uses monetary policy to stabilize Y.

Problem 4: Money Demand Increases

- (a) The exchange rate is allowed to float and there is no stabilization policy.
- **(b)** The exchange rate is fixed and there is no stabilization policy.
- **(c)** The exchange rate is floating, the central bank uses monetary policy to stabilize Y.

Problem 5: Foreign Output Increases

- (a) The exchange rate is allowed to float and there is no stabilization policy.
- **(b)** The exchange rate is fixed and there is no stabilization policy.
- **(c)** The exchange rate is floating, the central bank uses monetary policy to stabilize Y.

Problem 6: Expected Depreciation

- (a) The exchange rate is allowed to float and there is no stabilization policy.
- **(b)** The exchange rate is fixed and there is no stabilization policy.
- (c) The exchange rate is floating, the central bank uses monetary policy to stabilize Y.
